ABSTRACTED-PUB-NO: SU 1688809A

BASIC-ABSTRACT:

Body (1) has closure device (2) forming circular slit (3), linked to inner toroidal space (4). Closure (2) is cylindrical or conical axially movable deflector; radial section of slit is ring shaped. Body and deflector are combined, with split passing via toroidal space.

As product enters it goes via circular slit (3) into toroidal space (4) to create swirling flow. Formation of localised velocity pulsation is linked with breakdown of swirls and with rotation of swirls about their own axes as well as round axis of homogeniser. This pulsation leads to deformation of dispersed particles causing them to split, to a degree determined by number of cavities, geometrical size, etc.

USE/ADVANTAGE - In food industry, as homogeniser for liquid products, e.g. milk. Specific productivity is increased and construction simplified.
